Checkpoint 1 Report

Department Course Timetable Management System | SENG 271

Field	Value
Version	Checkpoint 1 - submission snapshot
Prepared	10.11.2026
Team	Team 19
Members	Eren KARAKAŞ (@ErennKarakass); Semih Mertcan İÇYER (@semihicyer)
Repository	https://github.com/ErennKarakass/Daviser
Status	Completed work and remaining verification recorded as of 10.11.2026, 23:52 (Europe/Istanbul).

1. Submission Checklist

Item	Status / evidence
SRS v2	Uploaded: docs/requirements/SRS-v2.pdf; commit 5fcb26c.
SDD v2 and diagrams	Uploaded under docs/design/; commit 05156c3. Includes UML, flowchart and editable diagram sources.
Java skeleton	13 Java files uploaded under src/; commit 739d5f6.
Runnable menu	Semih ran Main in IntelliJ on macOS; menu displayed and input checks were exercised.
Design-code consistency	Source declarations and corrected diagram/member inventory were checked during package preparation. Full scheduling behavior remains planned.
README	Uploaded as README.md; commit 655ec85.
Both members contribute	Visible history contains commits by both ErennKarakass and semihicyer.
code-v1 tag and Release	Not yet verified at this snapshot.
Execution by both members / terminal	Semih IDE run confirmed; Eren run and student terminal runs not verified.

Revision History

10.11.2026: updated the report with observed repository uploads, actual commit identifiers and the student execution evidence. Replaced unsupported historical commit counts and dates from the initial document draft.

2. Design-Code Consistency Matrix

Class / source	Attributes and declarations	Relationships
TimeSlot / src/TimeSlot.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	Dependencies through method signatures where relevant; no domain fields.
Instructor / src/Instructor.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	unavailableSlots: List<TimeSlot>; preferredSlots: List<TimeSlot>
Room / src/Room.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	unavailableSlots: List<TimeSlot>
Course / src/Course.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	instructor: Instructor
Session / src/Session.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	course: Course; assignedSlot: TimeSlot; assignedRoom: Room
SpecialRequest / src/SpecialRequest.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	Dependencies through method signatures where relevant; no domain fields.
FileDataReader / src/FileDataReader.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	Dependencies through method signatures where relevant; no domain fields.
Timetable / src/Timetable.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	sessions: List<Session>
ConstraintChecker / src/ConstraintChecker.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	timetable: Timetable; requests: List<SpecialRequest>
Scheduler / src/Scheduler.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	timetable: Timetable; checker: ConstraintChecker; rooms: List<Room>; requests: List<SpecialRequest>; failures: Map<Session, String>
ClassroomRequestGen / src/ClassroomRequestGen.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	Dependencies through method signatures where relevant; no domain fields.
ReportWriter / src/ReportWriter.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	Dependencies through method signatures where relevant; no domain fields.
Main / src/Main.java	Consistent with corrected SDD v2; unfinished operations are explicit stubs.	Dependencies through method signatures where relevant; no domain fields.

The complete declaration inventory accompanies the design in docs/design/Class-Member-Inventory.md. Code v1 is a project skeleton: automatic scheduling, file loading, reports and manual modifications are not implemented. Constructors, basic model helpers and the menu are available.

3. Running the Application

Student environment: Semih Mertcan İÇYER, macOS on Apple Silicon, IntelliJ IDEA. JDK 21 was selected through the IDE downloader (Microsoft OpenJDK 21.0.13.0.2 aarch64). Main.main was run using the IDE Run action on 10.11.2026.

Check	Observed / reported result
Start Main	Screenshot shows the numbered console menu and Select an option prompt.
Enter 1	Screenshot: Option 1: not implemented in Code v1.
Enter abc	Screenshot: Please enter a number from the menu.
Enter 99	Student reported completing all requested checks; a separate result screenshot was not supplied.
Enter 0	Student reported that Goodbye. was displayed.

Selected console lines transcribed from the supplied student screenshots:

```
Select an option: 1
Option 1: not implemented in Code v1.

Select an option: abc
Please enter a number from the menu.
```

Compilation/run commands documented in README (student terminal execution remains unverified):

```
javac -d out src/*.java
java -cp out Main
```

Additional preparation checks: all 13 Java files compiled in the assistant environment using OpenJDK 21.0.13. Menu input/exit/EOF and implemented model boundary checks passed. These are separate from student execution evidence.

4. Key Requirements

ID	Requirement summary
FR-01	Read course information from CSV.
FR-06	Automatically construct schedules respecting hard constraints.
FR-08	Try alternative permitted slots and rooms.
FR-16	Reject invalid manual moves while preserving the old assignment.
FR-18	Distinguish room shortage from non-room constraints.
HC-01	No instructor overlap.
HC-03	No year-group overlap.
HC-05	Sufficient room capacity.

5. Algorithm and Conflict Handling

Question	Planned algorithm / SDD reference
Processing order	Mandatory fixed blocks first; then theory/lab, year, descending duration/students, session ID. SDD §6.1.
Candidate intervals	Consecutive intervals ending by 17:00; fixed blocks keep their exact required interval. SDD §6.1.
Room selection	Mandatory requested room where applicable; matching type and sufficient capacity, then preferences and capacity order. SDD §6.1.
Hard checks	ConstraintChecker.checkHard: HC-01..09 and mandatory room requests. SDD §6.4.
Conflicts	Try next eligible room, then next permitted interval; never move a mandatory fixed block to another time. SDD §7.
Unassigned sessions	After all candidates fail, record NO ROOM or CONSTRAINT with reasons. Greedy failure does not prove no feasible schedule exists. SDD §6.1.

6. GitHub Evidence

Repository: https://github.com/ErennKarakass/Daviser. Snapshot: latest observed commit 05156c3. The supplied history screenshot displays 11 commits: 5 by semihicyer and 6 by ErennKarakass. Counts describe this snapshot, before uploading this report. Earliest visible commit: 84fcee6, dated 10.11.2026 based on the contemporaneous screenshot. The tag code-v1 and published Release have not yet been evidenced.

Commit	Author	Change
84fcee6	ErennKarakass	Initial document upload
65ee249	ErennKarakass	Additional file upload; README shown in earlier repository view
739d5f6	semihicyer	Add Java project skeleton and runnable main menu
655ec85	semihicyer	Add project README and run instructions
357a85e	ErennKarakass	Delete superseded Checkpoint 1 Report
ee3d3e5	ErennKarakass	Delete superseded SDD v2
db31395	ErennKarakass	Delete superseded SRS v2
c2bb101	ErennKarakass	Delete superseded project_readme
c96f917	semihicyer	Create requirements folder
5fcb26c	semihicyer	Add revised SRS v2
05156c3	semihicyer	Add SDD v2 and design diagrams

7. Team Contributions

Member	Work evidenced to date
Eren KARAKAŞ	Prepared the initial three document drafts as reported by the team; uploaded original documents and README; removed superseded files. Six visible commits. Execution of the revised Java project is not yet confirmed.
Semih Mertcan İÇYER	Coordinated revisions; configured Java/IntelliJ; ran the menu and exercised input/exit checks; uploaded the revised source, README, SRS, SDD and diagrams. Five visible commits.

The revised Java skeleton and documentation were developed with AI assistance. Upload authorship is not presented as sole authorship of all generated code. Both members remain responsible for understanding and explaining the submitted work.

8. Plan to Checkpoint 2

Version	Planned work	Proposed owner
Code v2	CSV/TXT readers, validation and entity management	Split course/request and room/instructor readers between members; cross-review.
Code v3	First-fit scheduling, mandatory fixed requests and hard constraints	Both; agree checker/scheduler interfaces.
Code v4	Working scheduling core, readable outputs and regeneration	Both; run and explain the whole workflow.

9. Remaining Actions and Risks

Create and verify code-v1 tag and Release after the required team run checks. Confirm Eren's execution and both students' terminal runs. Confirm repository visibility against the Tutorial, which requests a private repository; the last visible repository view showed Public. Confirm the team agreement and WebOnline submission. The README and earlier prepared documents may retain pending-status text; synchronize it as actions are completed.

The visible history records same-day progress and does not demonstrate earlier weekly submissions. No earlier history is claimed. The planned greedy algorithm can leave a session unassigned even when another arrangement is feasible.

AI-Use Declaration

Tool	Use	Verification
ChatGPT (Codex)	Revision of team-provided requirements/design drafts; diagram correction; Java skeleton generation; README and report preparation.	Source/design alignment and compilation checks in the preparation environment; Semih subsequently ran the menu and checked input behavior in IntelliJ. Full team review and remaining execution checks are not claimed.
